

TRIOLOGY CONNECT OVERVIEW

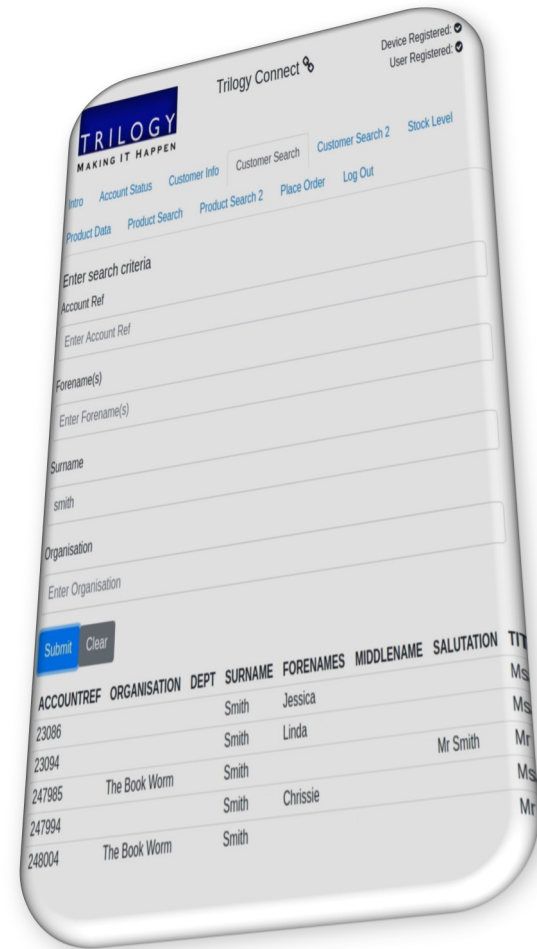

Trilogy Connect delivers a number of core Web Service functions that provide secure access to leverage the proven power of the Trilogy Publishing Manager ERP solution.

These functions provide the ability to build sophisticated apps on multiple platforms with no compromise on security and limitless new ways to interact.

These are delivered in the form of a growing 'toolkit' of apps for specific purposes such as real-time order processing from multiple mobile devices.

Trilogy Connect is available as individually licenced apps or the complete web services development toolkit. This will provide customers with the ability to develop specialist apps and integrate web services into other applications.

Once validated, these apps will be entered into the core library to ensure data compliance, security and controlled distribution.

The Trilogy publishing Manager ERP solution has been developed over many years and is the result of close partnerships with a number of publishing companies. It is comprised of a suite of targeted modules that can be used as stand alone software packages or in conjunction with others to form an end-to-end ERP solution designed to meet the complex demands of the modern publishing market.

Trilogy Connect is delivered as a library of Microsoft .Net Web Services complete with sophisticated user and device authentication.

BENEFITS

✓ IMPROVED CUSTOMER RELATIONS

Streamlined, real-time communication between customers and the sophisticated Trilogy Publishing Manager ERP system.

✓ SINGLE COHERENT SYSTEM

A seamless perspective of your entire organisation allowing for strategic decisions to be made based on facts taken from a single coherent system.

✓ IMPROVED DATA QUALITY

Add value to your customer database by ensuring information is up to date, easy to interrogate and simple to extract.

✓ FUTURE GROWTH

Fully scalable, module based infrastructure allowing your system to grow in line with your business needs.

✓ PLATFORM INDEPENDENCE

Trilogy Connect Web Services can be used to communicate with multiple platforms

WEB SERVICE FUNCTIONS

FEATURES LIST

Account Status	The Account Status function looks up a single customer using the Account Reference and returns the credit limit and accounts receivable status for the customer account.
Customer Information	The Customer Information function looks up a single customer using the Account Reference and returns a complete customer record. This includes invoice addresses, delivery addresses and communications options to ensure data protection compliance.
Customer Search	This Customer Search function searches for one or more customers using one or more columns such as account number, forename, surname and organisation to return list of customers.
Customer Smart Search	This Customer Smart Search function performs a smart search for customers across several columns, collating results. Examples are entering 'Smith' would find all of the contacts with the name 'Smith'. Entering 'Linda Smith' would return all of the contacts containing 'Linda' or 'Smith' with the best match at the top.
Stock/Inventory Level	The Stock Level function check the stock/inventory quantity level of a product for a Stock Number
Product Data	The Product Data function returns a product record from a Stock Number lookup. This returns a full set of product data including description, availability, pricing, selling and dimension information.
Product Search	This Product Search function returns one or more products based on searches in one or more columns such as keyword, ISBN, description and short description.
Product Smart Search	This Product Smart Search function performs a smart search on products across a variety of columns. Examples are entering 'Glouc' would find all of the products with the letters 'Glouc'. Entering 'Glouc Chelt' would return all of the product containing 'Glouc' or 'Chelt' with the best match at the top.
Place Order	The Place Order function combines a number of simple functions such as Customer and Product searches to build and submit an Order File record. This is a single page B2B ordering app that will work on anything from a PC to an iPhone.
User Authentication	The User Authentication function ensures access to web services and user data is consistent with settings in the ERP modules.
Device Authentication	The Device Authentication function ensures that only validated devices can access the web services apps.
